

PREPARED FOR MOVENTORY

Multi-store Shopify visibility for fulfillment operations.

A lean operational MVP to centralize order visibility across Moventory's Shopify brand partners, reduce store-switching, and validate the foundation for a future African warehouse management platform.

PHASE 1 BUILD**\$2.75k-\$3.75k**

CAD MVP INVESTMENT

EXECUTIVE SUMMARY

Shopify is built for one merchant. Moventory operates across many.

The core issue is not fulfillment execution itself. It is fragmented operational visibility across storefronts. Moventory acts as a centralized fulfillment partner for multiple brands, but each Shopify store still behaves like a separate operational silo.

Current bottleneck

The team manually checks individual Shopify stores throughout the day to catch new orders, returns, delivery needs, and fulfillment exceptions. This works at a small scale, but it becomes increasingly fragile as more brands join.

Recommended move

Build a lean operational visibility MVP before investing in heavy platform infrastructure. The MVP should validate workflow behavior, reduce daily context switching, and establish the technical foundation for future orchestration.

PROOF OF CONCEPT ALREADY VALIDATED

- Shopify Admin API integration
- OAuth-authenticated order retrieval
- Consolidated dashboard structure
- Customer, fulfillment, and line-item visibility
- Centralized order queue foundation
- Future-ready structure for additional workflows

~90%

CURRENTLY SHOPIFY-LED OR SHOPIFY RELEVANT

24/day

MANUAL STORE CHECKS AT 8 STORES X 3 CHECKS

OPERATING PROBLEM

Manual store-checking is becoming the scalability bottleneck.

What happens today

- Each Shopify store is checked separately multiple times per day.
- Warehouse checks and Shopify checks are split across different places.
- New orders, returns, and delivery issues require manual attention.
- Moventory must remember which stores have and have not been checked.

Why it breaks as volume grows

- A next-day order can be missed until it is already late.
- Inventory counts can drift between Shopify and the physical warehouse.
- Shopify notifications route to the merchant, not necessarily Moventory.
- Moving from 8 Shopify brands toward 14+ makes the current approach untenable.

STRATEGIC PRINCIPLE

Phase 1 should not attempt to replicate Shopify Admin. The highest-leverage move is to create an operational queue that shows what Moventory needs to act on across stores.

RISK	OPERATIONAL IMPACT	PHASE 1 RESPONSE
Missed new orders	Late fulfillment, especially for next-day shipping.	Unified queue sorted by newest order first.
Store-switching fatigue	Manual checks compound as new brands onboard.	One dashboard across initial Shopify stores.
Inventory uncertainty	Physical warehouse and store data can diverge.	Foundation for inventory verification workflows.
Notification gaps	Shopify alerts are not optimized for Moventory's multi-brand role.	Future notification and exception layer.

PROPOSED BUILD

Operational Visibility MVP: one queue for multi-store Shopify orders.

Phase 1 goal

Eliminate the need to manually log into multiple Shopify stores throughout the day just to know whether there are orders requiring attention.

- Consolidated order dashboard
- 3-5 Shopify integrations initially
- Centralized operational queue
- Customer and fulfillment visibility
- Store/client source column
- Basic filtering and search
- Operational status foundation
- Deployment and documentation

Recommended stack

- Python + Streamlit
- Shopify GraphQL Admin API
- Render or Streamlit Cloud hosting
- Lightweight architecture that can graduate into a fuller platform

Estimated hosting: CAD \$10-\$30/month depending on usage.

Prototype dashboard: consolidated order queue with store, order, customer, financial status, fulfillment status, and line-item visibility.

TECHNICAL VALIDATION

The first technical risk has already been reduced.

The proof of concept intentionally focused on validating the operational bottleneck and Shopify data path before scaling architecture decisions.

Source environment: Shopify order data with fulfillment and payment statuses.

CONNECT 3-5 REAL BRAND STORES

ILLUSTRATIVE BUSINESS CASE

A small visibility layer can remove a meaningful amount of daily coordination.

INPUT	LOW CASE	HIGH CASE	NOTES
Manual checks per day	24	24	8 stores x 3 checks/day from discovery notes.
Minutes per check	5	8	Includes login, search, review, and context switching.
Hours per month	43	69	Assumes 5 operating days/week and 4.33 weeks/month.
Loaded hourly value	\$30 CAD	\$45 CAD	Illustrative operating labor/opportunity cost.
Monthly labor value	\$1,300 CAD	\$3,100 CAD	Before factoring missed orders, late shipments, or client trust.

Operational upside

- Fewer missed next-day orders.
- Less manual context switching across stores.
- Faster awareness of fulfillment exceptions.
- Cleaner onboarding path as new brands join.

Potential payback

With a Phase 1 build cost of CAD \$2,750-\$3,750, the labor-only payback can plausibly fall in the 1-3 month range, depending on actual check time, staff cost, and adoption.

This is an illustrative model, not a guarantee. The MVP should measure actual usage and workflow savings once deployed.

PHASED EXPANSION

Start with visibility. Then add workflow. Then scale into a platform.

1**Operational Visibility MVP**

Consolidated order dashboard, multi-store integrations, basic search/filtering, store source column, order queue, deployment, and documentation.

2**Workflow & Fulfillment Layer**

Inventory verification, shipping label orchestration, returns workflows, notifications, statuses, assignments, audit trail, and additional integrations.

3**Scalable Platform Infrastructure**

Full OAuth onboarding, production-grade infrastructure, user roles, expanded integrations, inventory reconciliation, and potential client-facing capabilities.

LONG-TERM OPPORTUNITY**Africa's warehouse management layer**

Moventory's operating model points toward a niche WMS and fulfillment orchestration layer for African and diaspora brands selling through Shopify and related commerce platforms.

SCOPE DISCIPLINE**Do not overbuild too early**

The fastest path to clarity is to validate order visibility and internal behavior first, then graduate successful workflows into a more robust SaaS-style platform.

COMMERCIAL RECOMMENDATION

Build the smallest useful system that proves the operating model.

4 weeksESTIMATED IMPLEMENTATION
TIMELINE**\$2,750-\$3,750**

CAD PHASE 1 BUILD RANGE

\$10-\$30

ESTIMATED MONTHLY HOSTING

Ongoing support options

- Basic Maintenance Retainer: CAD \$250-\$500/month.
- Operational Support & Enhancements: CAD \$750-\$1,500/month.
- Support can cover store onboarding, Shopify API changes, feature improvements, monitoring, reporting, and workflow refinements.

Immediate next steps

- Confirm the initial 3-5 Shopify stores for Phase 1.
- Confirm required fields and status workflow for the order queue.
- Provide Shopify access path for production integration.
- Approve Phase 1 scope, timeline, and commercial range.

PROPOSED SUCCESS CRITERIA

- Moventory can see new orders from connected stores in one view.
- The team can identify store source, customer, items, and fulfillment status.
- The dashboard reduces manual Shopify checks during daily operations.
- The MVP creates a clear foundation for inventory and label workflows.
